

Rohitash Kator

Software Engineer – Backend & Cloud

📞 +91-9785787351 | ✉️ rohitashkwmwt@gmail.com | 🔗 linkedin.com/in/itsrkator | 🐙 github.com/itsrkator | 📍 Pune, India

Professional Summary

Backend-focused Software Engineer with 3.5 years of production experience designing, scaling, and shipping microservices and API-driven platforms across FinTech, analytics, and AI/LLM document-processing domains. Expert in Node.js (Express, NestJS), TypeScript, and Python; hands-on with Go in distributed systems. Delivered cloud-native solutions on GCP and AWS using Kubernetes, Docker, Redis, RabbitMQ, and Kafka. Google Cloud Certified Associate Cloud Engineer and Professional Data Engineer; GitHub Copilot Certified Professional. Known for owning features end-to-end, driving measurable accuracy and operational improvements, and shipping secure, maintainable code with clear business impact.

Technical Skills

Languages: *JavaScript, TypeScript, Python, Go, Java*

Backend: *Node.js, Express.js, NestJS, Fastify, Microservices, REST APIs, GraphQL, WebSockets, Flask, Gin*

Frontend: *React.js, Angular, HTML5, CSS3*

Databases: *PostgreSQL, MySQL, MongoDB, SQLite, Redis, Elasticsearch*

Cloud/DevOps: *GCP, AWS, Docker, Kubernetes (K8s), CI/CD, Looker, Looker Studio*

Messaging: *RabbitMQ, Kafka, Socket.IO*

AI / LLM: *OpenAI API, AWS Textract, Vertex AI, GitHub Copilot, Cursor*

Testing: *Jest, Supertest, pytest, unittest, Integration Testing*

Tools: *Git, GitHub, JIRA, Postman, DBeaver, VS Code*

Certifications

- Google Cloud Certified – Associate Cloud Engineer (ACE)
- Google Cloud Certified – Professional Data Engineer (PDE)
- GitHub Copilot Certified Professional

Professional Experience

Software Engineer

Talentica Software | Remote, Pune

Nov 2024 – Present

Full-Time

Client: Mist Systems (Juniper Networks / HPE) – Multi-Codebase Unit Testing | *Python, pytest, unittest, FastAPI, Flask, Go, Cursor, GitHub Copilot*

- Writing automated unit test suites across multiple Python and Go microservice repositories – covering REST APIs, Kafka consumers, Zookeeper interactions, AWS Lambda paths, and Kubernetes-touching operational code – improving baseline coverage from near-zero to regression-safe levels.
- Extended pytest coverage for HTTP layers, document-store client contracts, caching semantics (miss/None paths), metrics registration, and response-shape assertions; implemented Go tests for HTTP proxies, sync jobs, and device-log ingestion integrated with Docker/Make-driven CI.
- Strengthened mock-heavy suites by asserting routing logic, query construction, and empty-path contracts rather than raw HTTP 200 status, measurably increasing defect-detection confidence across distributed services.
- Accelerated test scaffolding, parametrization tables, and mock wiring using Cursor and GitHub Copilot, cutting repetitive authoring time by approximately 40% while maintaining rigorous manual review of edge cases and contract alignment.

Client: Triller – Julius Influencer Marketing & Campaign Platform | *TypeScript, Node.js, NestJS, GraphQL, MySQL, Redis, RabbitMQ, Elasticsearch, AWS, Phyllo API, Angular*

- Contributed to a production microservices platform enabling brands and agencies to discover influencers and measure campaign performance across Instagram, TikTok, and X (Twitter) using NestJS, GraphQL, RabbitMQ, Redis, and Elasticsearch on AWS.
- Designed and fixed campaign lifecycle tracking logic that preserved active trackings through status transitions, eliminating analytics inconsistencies that had caused payout calculation errors across the reporting service.
- Built Instagram Stories ingestion via Phyllo API in a dedicated NestJS microservice, normalizing story media and engagement metrics (reach, impressions) and replacing brittle scrapers with a reliable, maintainable data pipeline.
- Enhanced a GraphQL-based reporting service with new schema fields, deliverable traceability, and Prometheus metrics instrumentation, improving observability and audit accuracy for marketer-visible analytics.
- Improved social data ingestion reliability using CRON-based workflows and backfill logic, ensuring historical reach and engagement data was incorporated without double-counting into analytics graphs.
- Strengthened rollout safety through feature flags, safer defaults, and unit/integration test coverage; resolved production data integrity issues across campaign and influencer status transitions.

Software Engineer

Eternalight Infotech | Remote, Pune

Feb 2024 – Nov 2024

Full-Time

Client: FamO – FinTech Family Investment Tracking Platform | *TypeScript, Node.js, NestJS, React.js, PostgreSQL, TypeORM, Firebase*

- Built core backend features for a FinTech platform tracking investments across mutual funds, equities, bonds, real estate, and private deals; developed family onboarding, deal digests, real-time discussions, messaging, and push notifications using NestJS, PostgreSQL, and Firebase.
- Integrated real-time market data APIs to compute portfolio valuation, P&L, and actionable investment insights, enabling accurate financial reporting across multiple asset classes for family groups.
- Designed scalable PostgreSQL schemas and developed secure, high-performance APIs for financial operations, ensuring data integrity and compliance across all investment workflows.

Client: FamO – Contract Note Parser (AI Document Processing) | *Python, Flask, PostgreSQL, AWS Textract, OpenAI, LLMs*

- Designed and built an LLM-powered document processing service using Python, Flask, AWS Textract, and OpenAI to extract structured transaction data from broker contract note PDFs with 95%+ accuracy across varied formats.
- Implemented Python multi-threading and 10-page chunking strategy that significantly reduced end-to-end PDF processing time, enabling high-volume document ingestion at scale.
- Built pre-persistence validation workflows that eliminated over 90% of manual data entry for back-office operations, directly improving efficiency and reducing human error in financial record-keeping.

Cloud Engineer

SpringML Inc. | Remote, Hyderabad

Jul 2022 – Nov 2023

Full-Time

- Designed and developed MGIC DocAI, an AI-powered invoice parsing system (Angular, Python/Flask, Vertex AI, PostgreSQL) that automated structured data extraction from diverse invoice formats, significantly reducing manual review time and processing overhead.
- Built dynamic, filterable analytics tables with debounced search for a Vehicle Crash Analytics Platform (Node.js, Angular, GCP, MySQL), improving data exploration performance and usability across large datasets; implemented export-to-PDF reporting.
- Managed GCP IAM configurations to enforce least-privilege access across multiple client projects, maintaining security compliance and cloud governance standards.
- Built interactive Looker and Looker Studio dashboards delivering real-time operational insights to stakeholders, reducing manual reporting effort and enabling data-driven decision-making.

Software Engineer Intern

iLink Digital | Remote, Pune

Jan 2022 – Mar 2022

- Developed RESTful APIs using Python, Flask, and Django for a data-driven analytics platform; built real-time monitoring dashboards using Grafana integrated with PostgreSQL and Elasticsearch.

Software Developer Intern

Jivrus Technologies | Remote, Bangalore

May 2021 – Nov 2021

- Built an online assessment proctoring feature including camera tracking, screen monitoring, and secure media storage; integrated Google Drive and Maps APIs for scalable storage and geolocation functionality.

Key Projects

Poll Management System | *Node.js, Express.js, React, Angular, MongoDB, REST APIs, JWT, Jest, Supertest*

- Built a production-grade poll management system with dynamic questions, real-time result reporting, and role-based access (Admin/User); implemented JWT authentication with token blacklisting, bcrypt hashing, rate limiting, xss-clean, and Helmet; achieved full unit/integration test coverage via Jest and Supertest.

Real-Time Chat Application | *NestJS, Angular, PostgreSQL, Socket.IO, TypeORM, JWT, Google OAuth, bcrypt*

- Engineered a full-stack real-time chat platform with JWT + Google OAuth 2.0 authentication, Socket.IO WebSocket messaging, Slack-style rooms, delivery/read receipts, typing indicators, and in-app notifications; designed normalized PostgreSQL schema with TypeORM migrations and seed scripts.

Employee Management System | *Go, Gin, MongoDB, Clean/Hexagonal Architecture, slog*

- Built a production-ready Employee Management REST API in Go using Clean/Hexagonal Architecture with CRUD, filtering, search, and pagination; implemented structured JSON logging (slog), request timeouts, request-ID middleware, and graceful shutdown.

Event Booking API | *Go, Gin, SQLite, JWT, bcrypt*

- Developed a REST API for event management and registration with JWT authentication, bcrypt password hashing (cost 14), and role-aware authorization; built layered architecture (routes, controllers, models, middleware) with public vs. protected route groups.

Education

Bachelor of Technology (B.Tech), Computer Science and Engineering

National Institute of Technology (NIT), Andhra Pradesh | Tadepalligudem, India

Aug 2018 – Jun 2022
